

I'm not robot!

Tous les examens complémentaires ont pour intérêt en plus des examens d’imagerie d’affiner notre diagnostic. Permet de détecter ou d’éliminer un cancer de prostate Le cancer après 50 ans, même si des formes plus précoces peuvent être diagnostiquées, notamment en cas de cancer prostatique chez les autres hommes de la famille avant 65 ans. Il n’entraîne initialement aucun trouble, et ne peut être diagnostiqué précocement que par l’examen clinique et un examen sanguin, le dosage du PSA (Prostate Specific Antigen, protéine excrétée par la prostate, et dont le taux sanguin augmente en cas de pathologie prostatique, notamment le cancer). Il sera confirmée par des biopsies de la prostate réalisées le plus souvent sous anesthésie locale. Plus d’information pour les biopsies de la prostate : L’examen urodynamique Permet de mieux comprendre le fonctionnement de la vessie et de son sphincter. Il repose sur l’enregistrement des volumes, pressions et débits urinaires. La mesure de l’activité électrique des muscles du périnée est également possible. Afin de bien bilancer les patients qui ont une incontinence urinaire ou des troubles urinaires, il est parfois nécessaire de réaliser un bilan urodynamique qui nous permet de savoir comment fonctionne la vessie, le sphincter. C’est un examen sous anesthésie locale, non douloureux. Pour plus d’informations : Uréthrocystoscopie C’est un examen qui permet avec une caméra sous anesthésie locale d’explorer la filière urologique (urètre, prostate, vessie), afin de dépister une anomalie : tumeur de vessie, calcul, obstruction liée à la prostate, sténose (= rétrécissement jde l’urètre …..). C’est un examen non douloureux, sous anesthésie locale, le plus souvent en consultation simple.
